

Polyglot OSGi

or, “How to sneak your
favorite language into the
enterprise!”

polyglot

Many Languages

From Ancient Greek πολύγλωττος
(poluglōttos), ““many-tongied, polyglot””), from
πολύς (polus), ““many””) + γλῶττα (glōtta),
““tongue, language””

Polyglot Programming

We are entering a new era of software development. For most of our (short) history, we've primarily written code in a single language...but I'm beginning to see a time where even the core language...will cease its monoculture...applications of the future will take advantage of the polyglot nature of the language world...it's all about choosing the right tool for the job and leveraging it correctly...the times of writing an application in a single general purpose language is over.

- Excerpts from: Neil Ford, "Polyglot Programming"

<http://memeagora.blogspot.com/2006/12/polyglot-programming.html>

The Golden Hammer Anti-pattern

Using the same tool, product, or technique to solve every problem

The Golden Hammer Anti-pattern

Using the same tool, product, or technique to solve every problem

why Polyglot OSGi?

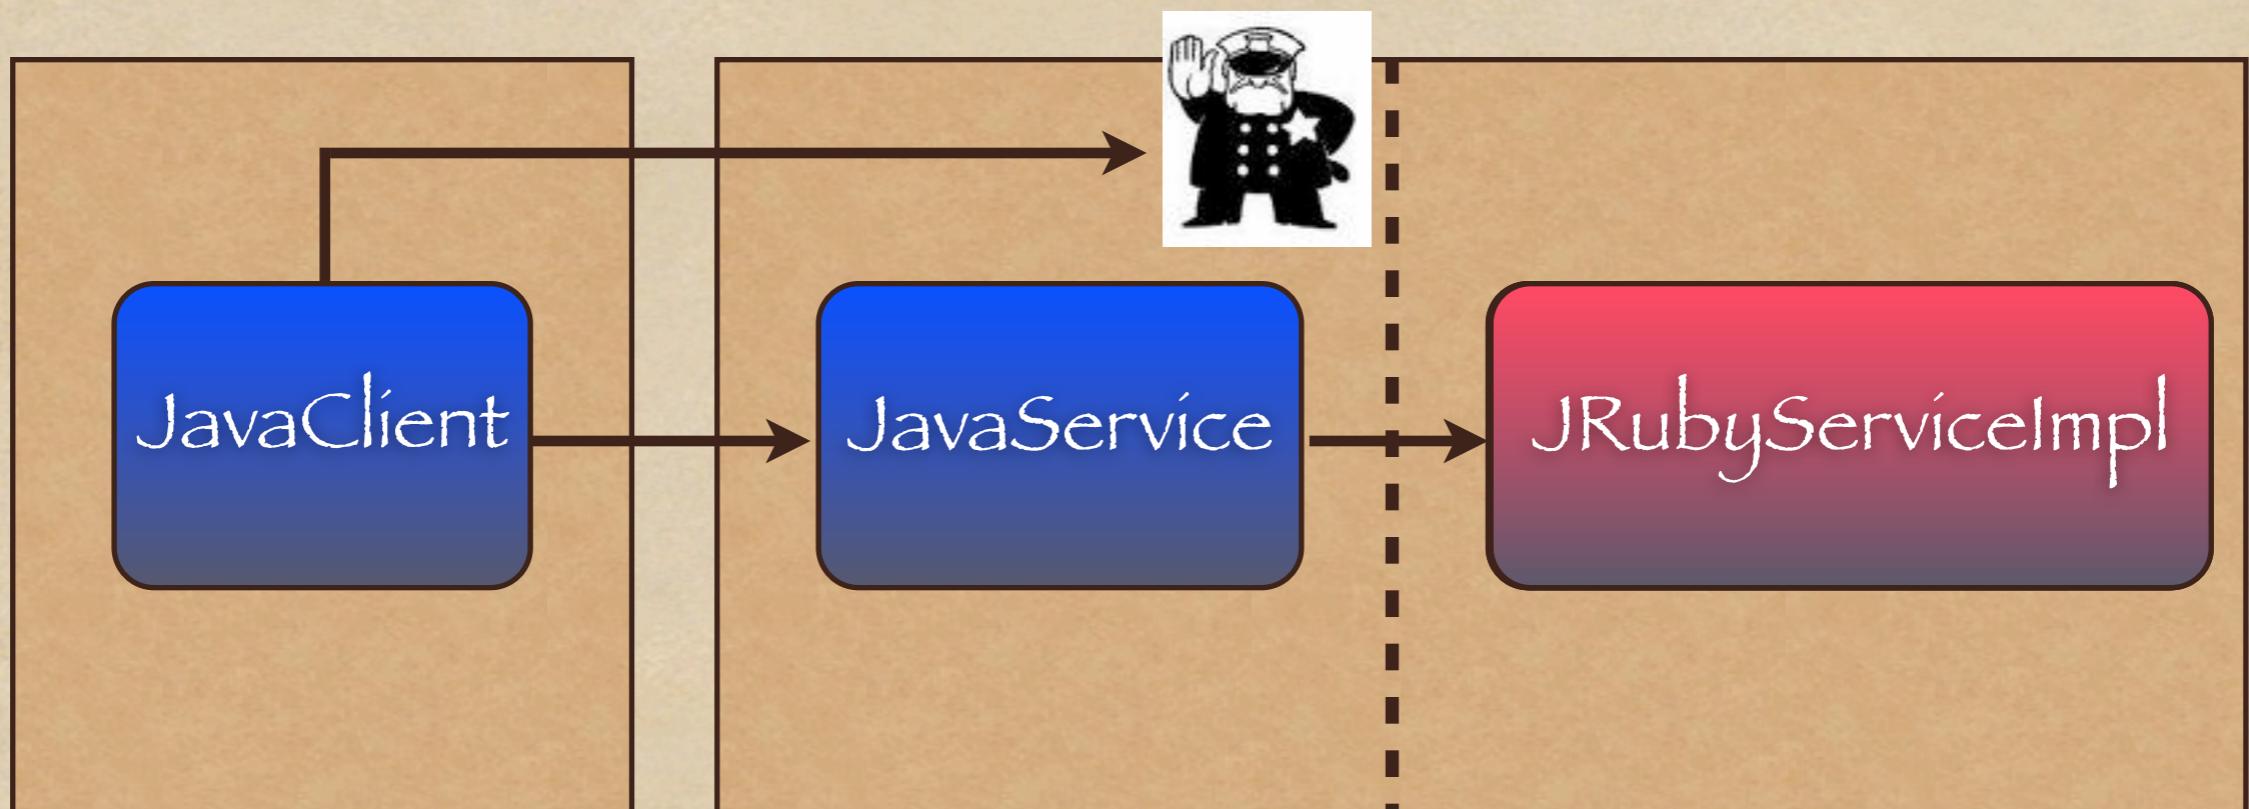

why Polyglot OSGi?

why Polyglot OSGi?

why Polyglot OSGi?

Polyglot OSGi Pros

- ◆ Manage Risk
- ◆ Encapsulation
- ◆ Decoupled Architecture
- ◆ Java = JVM Lingua Franca

Polyglot OSGi Cons

- ◆ Constant Java translation at boundary
- ◆ Less idiomatic code
- ◆ Language / OSGi mismatch
(Classloader hell)
- ◆ Not a silver bullet for large teams with
few polyglots

A Polyglot OSGi Vending Machine

- ◆ Valid Actions:
 - ◆ NICKLE, DIME, QUARTER, DOLLAR - insert money
 - ◆ COIN RETURN - returns all inserted money
 - ◆ SERVICE - a service person opens the machine and sets the available change and items
 - ◆ GET-A, GET-B, GET-C - select item A (\$.65), B (\$1), or C (\$1.50)

A Polyglot OSGI Vending Machine

- ◆ Valid Responses:
 - ◆ NICKLE, DIME, QUARTER - return coin
 - ◆ A, B, C - vend item A, B, or C
- ◆ Track state:
 - ◆ available items (count, price, selector)
 - ◆ available change (# of nickles, dimes, quarters, dollars available)
 - ◆ currently inserted money

A Polyglot OSGi Vending Machine

- ◆ Example Traces:
 - ◆ Buy B with exact change:
Q, Q, Q, Q, GET-B
-> B
 - ◆ Add change, hit coin return:
Q, Q, COIN-RETURN
-> Q, Q
 - ◆ Buy A without exact change (return \$.35)
DOLLAR, GET-A
-> A, Q, D

Why this spec?

- ◆ Simple to understand, yet...
- ◆ ...demonstrates reasonable complexity one might find in a real application
- ◆ Algorithms suitable for showcasing language features

Goals

- ◆ Implement a Java interface contract for the spec
- ◆ Test-drive a Java implementation
- ◆ Use tests as a contract to implement in:
 - ◆ Groovy
 - ◆ Scala
 - ◆ Clojure
- ◆ Build a Spring MVC application to exercise different vending machines

Java Contract, Tests,
Implementation

Groovy Implementation

Scala Implementation

Scala Gotchas

- ◆ Scala in Maven Central is NOT an OSGi Bundle!
- ◆ Can download from <http://scala-lang.org>.
- ◆ Swap it out manually...
- ◆ ...however...
- ◆ won't work with Maven anymore!
- ◆ Use Groovy script to swap out Scala jars.

Clojure Implementation

Clojure Gotchas

- ◆ Clojure also not available as an OSGi bundle!
- ◆ Use Pax Construct to embed in bundle for Clojure implementation.
- ◆ Mixed experiences out there with trying to share a common Clojure bundle.
- ◆ OGEE Project (<http://ogeessource.org>)

Clojure Gotchas

- ◆ Not OSGi related, but...
- ◆ Maven Clojure Plugin won't seem to compile Clojure first, so if your Java code depends on Clojure code...
- ◆ Must run “mvn clojure:compile” first

Spring MVC Web Implementation

That's all folks!
